Inspiring the Secondary Curriculum with Technology James Shea 2014-10-24 Are other teachers using technology in their lessons? Are you letting your own students down by not harnessing the power of your students' technology knowledge in your lessons? Is your school asking you to show where you are developing ICT in your subject teaching? Technology in your subject does not mean teaching databases, spreadsheets or word processing. Having technical knowledge is no longer sufficient or indeed necessary in today's world – more important is the knowledge of

how to advise and teach students to use technology efficiently and responsibly through their subject. Students faced with a 'problem' will need to hunt the internet for open source software, download apps and respond to the problem using technology as a problem solving tool. The scenarios are endless, but can be generated by the teacher - this could mean students publishing work through Amazon's Kindle or keeping a blog within a class wiki. Teachers do not need to have technical knowledge; rather they need knowledge of trends and opportunities. They then need to blend their basic subject pedagogy within these new trends to contextualise ICT skills. This book looks at pedagogical approaches to using technology in the classroom that will help you to harness future trends, technology and software and embed them into your subject teaching. Full of practical advice, it illustrates how secondary teachers – of any discipline – can accelerate their students' learning, progress and ability within their subject whilst developing the ICT skills needed in the workplace and society. Including case studies and examples throughout, chapters cover: Blended Learning (mixing traditional teaching methods with e-learning) Developing interactive students Mobile technologies Student safety online E-Portfolios and Virtual Learning Environments This timely new book will help you structure your teaching to harness the latest developments in technology in tandem with the students you teach.

Forest Fire Danger Prediction Using Deterministic-Probabilistic Approach

Baranovskiy, Nikolay Viktorovich 2021-05-21 Forest fires cause ecological, economic, and social damage to various states of the international community. The causes of forest fires are rather varied, but the main factor is human activity in settlements, industrial facilities, objects of transport infrastructure, and intensively developed territories (in other

words, anthropogenic load). In turn, storm activity is also a basic reason for forest fires in remote territories. Therefore, scientists across the world have developed methods, approaches, and systems to predict forest fire danger, including the impact of human and storm activity on forested territories. An important and comprehensive point of research is on the complex deterministic-probabilistic approach, which combines mathematical models of forest fuel ignition by various sources of high temperature and probabilistic criteria of forest fire occurrence. Forest Fire Danger Prediction Using Deterministic-Probabilistic Approach provides a comprehensive approach of forest fire danger prediction using mathematical models of forest fuel with consideration to anthropogenic load, storm activity, and meteorological parameters. Specifically, it uses the deterministic-probabilistic approach to predict forest fire danger and improve forest protection from fires. The chapters will cover various tree types, mathematical models, and solutions for reducing the destructive consequences of forest fires on ecosystems. This book is ideal for professionals and researchers working in the field of forestry, forest fire danger researchers, executives, computer engineers, practitioners, government officials, policymakers, academicians, and students looking for a new system to predict forest fire danger.
